

Nature-based Solutions protect biodiversity, restore ecosystems and strengthen the connection between people and nature.

The health, wealth, and overall well-being of Pacific Island communities rely on the diverse benefits provided by thriving natural ecosystems. There are many actions we can take to champion nature for our wellbeing and resilience to climate change.

Farm with trees to protect our soil and grow more local food. Composting, mulching, covering crops and planting trees around food crops help us grow more food and keeps our soil healthy.

Remove the Invasive Alien species that are taking over our islands. Removing and controlling invasive pests helps restore our native forests and protect our food.

Protect our waterways and our future. Protecting forests, restoring catchment, keeping out livestock and planting native trees along the river edge supports clean and safe river water for the health of our families.

Restore coastal vegetation to protect our homes from storms. Mangrove and coastal vegetation protect us from floods, storms, and erosion, and serve as nurseries for fish.

Participate in community-based fisheries management. We need size limits, protected areas and to stop destructive practices such as nighttime spearfishing, poison and explosive to ensure enough fish for our community and our children.
