IMPORTANT - DISCLAIMER

The authors and all organisations responsible for the production of this guide do not make any claims that the manufacturers of patent medicines included herein have used endangered species in the production of these medicines. All references to the ingredients of manufactured patent medicines contained herein are based solely upon the interpretation of the packaging of the medicines examined. This interpretation does not verify that these medicines genuinely contain the species as stated, it merely documents where packaging has indicated that its ingredients contain said species. This interpretation is based upon the claims or indications on specific examples of medicine packaging, held by enforcement agencies. The packaging of these medicinal products may have subsequently been adapted, amended or discontinued and it should

therefore be noted that current packaging may no longer claim to contain such species. Furthermore, there is evidence of significant counterfeiting of patent medicines and many of the examples provided here may in fact be such counterfeits. The description of the contents of counterfeit medicines is clearly beyond the control of the genuine manufacturers whose names and trade marks may be reproduced on counterfeit products. Many medicine examples herein may also be old stock, produced prior to the restriction of use of endangered species under domestic laws in the countries of manufacture.

FOREWORD

At the 12th meeting of the Conference of the Parties (Santiago, 2002) a CD Rom of the first edition of the Traditional Asian Medicine Identification Guide for Law Enforcers was distributed to the delegations present and shortly thereafter also to all CITES Parties with a Notification. Hard copies of the guide were also distributed to the Parties by TRAFFIC International. At CoP12 the Secretariat decided that this excellent product of collaborative work between HM Customs and Excise's CITES Enforcement Team at Heathrow and TRAFFIC International should continue and be further developed.

Traditional medicines have a very long and important history in health care and although the parts and derivatives may not have changed much over the centuries, the packaging and commercial names do change. Even with the increased use of captive bred animals and artificially propagated plants, as well as the ongoing development of substitutes and/ or alternatives, the risk of overexploitation of some of the species and the illicit use of endangered ones has not disappeared.

In addition, more and more Parties are increasing their controls on the trade in medicines, thus improving the regulation of legal trade and more effectively combating illegal trade. This manual has proven to be an excellent tool judging from the fact that many additional copies of it were requested from the Secretariat.

At CoP12, the Secretariat entered into an agreement to produce a second edition before CoP13, and I am pleased that this difficult work has been completed by the two original authors with contributions from various other organizations and individuals. This time a hard copy could not be produced as a consequence of the lack of funding (which unfortunately seems to be characteristic of our times). On the other hand, it made it easier to arrange all available information on particular medicine groups conveniently together and therefore to make the guide more easily accessible to users.

I am convinced that this second edition will be equally, if not more successful than the first one, and I hope that funds will be made available for a regular biennial update of this manual.

Willem W. Wijnstekers
Secretary General, CITES Secretariat, Switzerland

ACKNOWLEDGEMENTS

The authors wish to express their gratitude to the donors who supported this project: the CITES Secretariat, WWF-UK and the Department for Environment, Food and Rural Affairs who provided the funds for the production of this guide. The Taiwan Council of Agriculture supported some of the staff time for TRAFFIC.

Many people generously assisted in the production of this guide. Medicine examples used were supplied by many offices of HM Customs and Excise, the Metropolitan Police Service, and Hampshire Police in the UK, the Dutch Customs Service, the CITES Management Authority of Hong Kong and Taiwan Ministry of Justice, Investigation Bureau. Particular thanks go to the following for their support, advice and technical expertise:

Steven Broad	TRAFFIC International
Stuart Chapman	WWF-UK
CITES Team	HMCE, Heathrow Airport
Robin Cooper	HMCE, London
Julie Gray	TRAFFIC International
Sean Lam	TRAFFIC East Asia
Samuel Lee	TRAFFIC East Asia
Charles Mackay	HMCE, Heathrow Airport
Rob Parry-Jones	TRAFFIC
Marcus Phipps	TRAFFIC
Ger van Vliet	CITES Secretariat
Willem Wijnstekers	CITES Secretariat
Nick P. Williams	Department for Environment, Food and Rural Affairs
Dr. Uwe Schippmann	Federal Agency for Nature Conservation, Germany
Natalie Hofbauer	Federal Agency for Nature Conservation, Germany

Special thanks go to Arno Hengeveld, from the General Inspection Service in the Netherlands who assisted greatly by providing many new medicine images, and by working alongside HMCE in the development of the new version of this identification guide.

HOW TO USE THIS GUIDE

The production of an identification guide for traditional Asian medicines in trade was thought necessary to assist enforcers to determine which medicines and ingredients are legal or illegal, in the context of the cases they are dealing with. The majority of law enforcers have no knowledge of Chinese characters and the many forms that these medicines take. This guide is primarily for law enforcers based outside Asia, in countries where large volumes of traditional Asian medicines are imported. The regions where this version of the guide may be of most use include Europe, North America and Australasia.

The format of the second version of the guide is the same as first one, but no hard copy will be produced. The format of the guide remains so that a hard copy can be printed by the user if they wish. The images contained here of patent medicines and the details found on them, were compiled by Her Majesty's Customs and Excise (HMCE) CITES Team at Heathrow Airport and TRAFFIC East Asia Taipei. HMCE and TRAFFIC have worked together in developing this guide to aid enforcers in identifying which of the many thousands of medicines in trade contain, or claim to contain species listed in the CITES Appendices and Annexes of the EU Regulation. This guide contains 810 full colour images of traditional Asian medicines with corresponding information for each medicine, detailing the product name, manufacturer and alleged ingredients. The images are of medicines that have been confiscated by enforcement agencies because they claim to contain controlled species. Some medicines that do not claim to contain controlled species have also been included because of their close similarity to a medicine that does.

The main section of this guide contains images and information on the most commonly found patent medicines in international trade outside Asia. Other sections have also been provided to give detailed guidance to assist in identification or as useful background information. These include some information on the medicinal trade; a section on fakes and forensics, and a section on identification of frequently used species and their derivatives found in products, according to different types of naming systems used in traditional medicine. There is also a section with information on the legislation relevant to this trade and how it operates, and a section to help in identifying both animal and plant raw ingredients.

To assist in identification of patent medicines, the products have been divided into different colour coded categories according to the form in which the medicine is manufactured.

PLASTERS	1
CAPSULES / PILLS	2
MEDICINE BALLS	3
RESIN BLOCKS	4
POWDERS	5
LIQUIDS	6
MISCELLANEOUS	7

There are two parts to the identification system - images of the patent medicine packaging and tables detailing the information held on the packaging, such as its ingredients. Each colour page of images has a correlating page that contains the table of information relating to the images. The left-hand page contains the table that refers to the images on the right-hand page. The images and tables are cross referenced using lettering (A,B,C, D etc.).

There are different naming systems for the species and ingredients used. This guide documents the common (English) name, scientific (Latin) name, Chinese character, Chinese pinyin and Roman. Pinyin is the phonetic translation of Chinese characters and Roman text is the traditional pharmaceutical name given to the ingredients. Both pinyin and Roman are often used on traditional medicinal packaging in addition to the Chinese characters. In the tables the order of the ingredients is listed by common name (e.g. bear). Each ingredient may also have numbers next to it, for example: tiger bone^{1 2 3}. These numbers give further information on how the ingredient is shown on the ingredients list of the medicine, as detailed below. Where no number is written, it is not known how the ingredient is shown.

1 ingredient is shown in English and or Roman e.g. **Tiger Bone**, or **Os Tigris**

2 ingredient is shown in Chinese pinyin e.g. **Hu Gu**

3 ingredient is shown in Chinese characters e.g. **虎骨**

4 target species indicated by an image of the species

The names of the medicines have been copied directly from the packaging, so any typing errors that appear on the packaging remain in the tables to aid in identification.

Further information can be found in the 'Notes' column on the right-hand side of each table. Many products carry a unique identifying code, printed on the packaging by the manufacturer. These codes can be used as a definitive way of identifying products and determining the date of the patent of the medicine. There may be several versions patented over time, some with target species and some without. The code indicates which version of the product it is. These code numbers are preceded by the word 'rat' or 'ref', standing for ratification number or reference number.

The product images within each category have largely been grouped together according to the orientation of the overall shape of the packaging -

portrait:-

or landscape:-

How to identify a medicine using this guide:

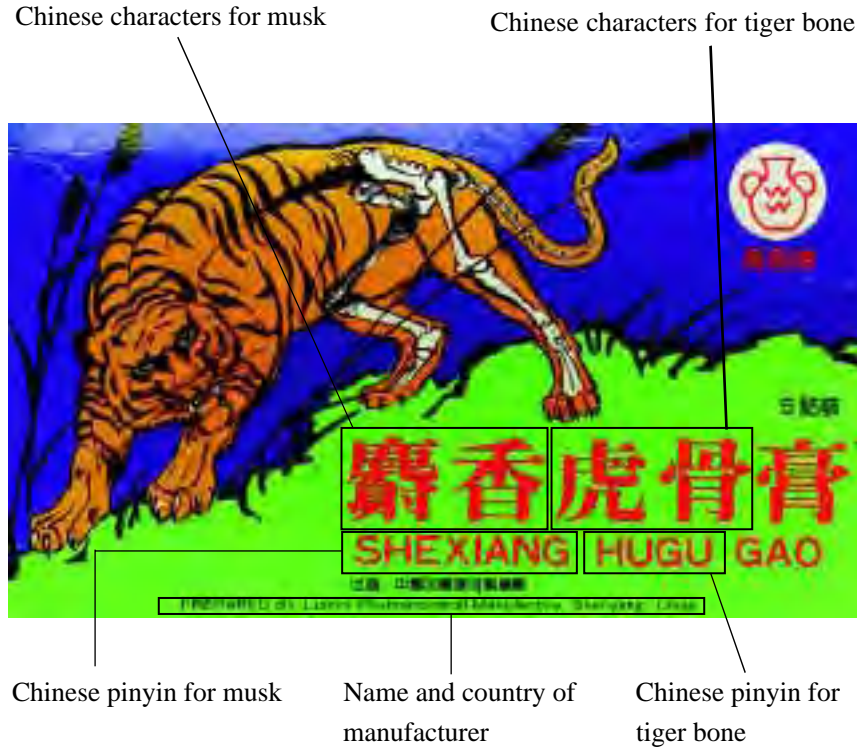

1. If the medicine name is identifiable, look it up in the Product Name Index. There may be more than one reference e.g. 3.6 C/D/E. 3.6 refers to the page number in the products sections and the letters C / D / E refers to the individual medicines listed.
2. If the manufacturer's details are identifiable, look them up in the Manufacturer Index.
3. What physical form does the medicine take? i.e. plaster, pill, powder etc. Find the beginning of the product section for that type of medicine and make a visual comparison.
4. If the packaging is a box, is it portrait or landscape in layout? Portrait images generally come first within each section, landscape images second.
5. Similar products have been placed together within each section - i.e. tiger bone plasters are together, as are musk plasters etc. If the medicine you are examining has an image of a lion or tiger on it, look for the groupings of such images in the section. Alternatively, if there is some text in English such as 'tiger and musk analgesic plaster' look in the sections on plasters for the tiger medicines.
6. By comparing the medicine you are examining with the images in the guide, it may be possible to identify the packaging if it is included in the guide. Once you visually match the specimen with the sample in the guide, refer to the text table associated with that image to determine if the medicine claims to contain controlled species.

NOTE: most of the medicines included in this guide do claim to contain controlled species. If the medicine you have is not included in the guide, then it is possible that it does not contain any controlled species. However, check carefully on the ingredients list to see if you can identify any Chinese characters depicting the name of a controlled species (see section on identification based on name systems). It may be necessary to arrange for the packaging to be translated to be absolutely sure. Do not assume that because the packaging looks identical that the ingredients list will also be the same. It is important to always check that the controlled ingredient associated with that packaging is still listed in the ingredients list.

The Chinese characters for 'ingredients' is: 成份 and 'formula' is: 處方

We need your samples! The authors would be grateful to receive any examples of the packaging of medicines that are controlled but do not appear in this guide. Please post packages to TRAFFIC International, 219a Huntingdon Road, Cambridge, CB3 0DL, UK, for inclusion in subsequent updates. Please do not send the contents of the medicine packaging.

THE TRADE IN TRADITIONAL ASIAN MEDICINE

Traditional Asian medicines

Traditional Asian medicine has been in existence for more than 5000 years. It relies on using animal and plant substances, which form the basis of raw ingredients for prescription medicine and manufactured patent medicines. The raw ingredients may be used directly after some preparation (grinding, washing, boiling, drying etc.) or may be made into factory-processed forms such as plasters, pills or tablets and packaged in mass quantities for national or worldwide distribution.

By definition, traditional Asian medicine includes traditional East Asian medicines (particularly traditional Chinese medicine [known as TCM] and medicine systems from Japan and South Korea) and Southeast Asian medicines (especially from Indonesia, Malaysia, Thailand, and Vietnam). The majority of medicines in this guide are TCM, which is the most significant for law enforcement worldwide. TCM is the most widespread Asian medical system and its application outside Asia is increasing. It is one of the main forms of health care in China and is widely used within expatriate Asian communities worldwide.

Concern about the use of threatened species in traditional Asian medicines grew in the late 1980s as numbers of rhinoceroses and tigers plummeted, largely because of poaching for the medicinal trade. Thousands of species of animals and plants are used in traditional Asian medicines and many of these species are controlled in international trade. In fact, in many cases such controls were partly as a result of demand for medicinal ingredients. Examples include: horn from rhinoceros, musk pods from musk deer, bile salts from bears, bones from tigers and leopards and stems from orchids.

CITES

Some species used in traditional Asian medicines are regulated in trade under the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). CITES bans certain species from commercial international trade (species in Appendix I), and regulates international trade in other species (species in Appendices II and III). It also stipulates that all goods labelled as containing any CITES species (such as patent traditional medicines), should be treated in law as actually containing them, even if in fact they do not. Many countries that have signed up to CITES (called Parties) have imposed strict measures to prohibit the production and trade of medicines using endangered species. CITES has recognised that wild fauna and flora are used in many forms of traditional medicines, and that their uncontrolled use has led to endangered species coming under increasing threat because of this demand.

From left to right: Customs search of a TAM sea freight import; Police search of a medicine importer's warehouse, © Crawford Allan/TRAFFIC International

To this effect a number of CITES Resolutions have been developed since 1994 when the real significance of the issue was first brought to the attention of the meeting of the Conference of the Parties to CITES (CoP). Resolution Conf. 9.6x (Rev.) was adopted at the ninth CoP in 1994, recommending Parties to ensure that their national legislation effectively controls trade in all parts and derivatives of species used for healing purposes and trade in medicinal products containing or purporting to contain them. This was further strengthened by Resolution Conf. 10.19 (Rev. Cop12), adopted at the 10th CoP in 1997, which urged Parties to work closely with traditional Asian medicine practitioners and consumers to develop awareness of the illegal use of endangered species in this traditional medicine. The Resolution aimed to encourage the strengthening and enforcement of legislation, to promote new techniques in the identification of parts and derivatives used and to investigate the potential for substitute ingredients for endangered species. At the 11th CoP in 2000, Document 11.56 provided an update on the recommendations made to the Parties in Resolution Conf. 10.19. There have also been a number of CITES Notifications to the Parties related to traditional Asian medicines. Notifications No. 1999/25 (animals) and No. 1999/26 (plants) contain lists of animal and plant species used in traditional Asian medicines.

National Controls

Some countries wish to control the wildlife trade at the national as well as the international level, and impose domestic measures. This provides a secondary level of control if medicines and raw materials have entered a country evading import controls. The following gives examples of some countries that have imposed national laws and regulations to control domestic trade in addition to the implementation of CITES.

In May 1993, in response to international conservation concern about the threat to rhinoceroses and tigers posed by the commercial trade, the State Council of the People's Republic of China issued a ban on trade in rhinoceros horn, tiger bone and their medicinal derivatives. This ban included the removal of these items from the official pharmacopoeia of China, and the cessation of all manufacture and commercial trade within China involving these ingredients.

In the USA, which has a significant expatriate East Asian community, the Rhino and Tiger Product Labelling Act was passed in 1998. This legislation makes it illegal to sell any medicine that lists rhinoceros or tiger as an ingredient on its label. Government regulatory agencies are no longer required to prove that these medicines are imported illegally and genuinely contain the ingredients they list on their labels.

In January 2000, the Japanese Government's Environment Agency announced an amendment to Japan's Law for the Conservation of Endangered Species of Wild Fauna and Flora, strengthening restrictions on domestic trade in tiger parts and derivatives. Japan is a significant consumer of Asian medicines and products, and up until this law was passed, products had been on open sale and unregulated. This law closes that possibility. In addition, all species threatened by the medicinals trade are protected by national legislation in their range States. Despite all of these measures, enforcement officers continue to encounter medicines labelled as containing parts of endangered species that are not legal.

The International Trade

The commerce in raw ingredients and manufactured patent medicines that contain CITES species is global, and legal and illegal shipments and domestic trade occur regularly throughout the world. The widespread availability of traditional Asian medicines in countries outside Asia is probably the combined result of numerous factors:-

- the expansion of trade from Asia
- the active promotion of medicinal exports from East Asia
- the growing populations of East Asian descent or origin, including Chinese, Japanese, Korean and Vietnamese, in countries around the world
- the growing production and availability of literature about traditional Asian medicine in many languages
- the growth and interest in natural health products, particularly outside Asia

Medicines claiming to contain CITES Appendix I species are still found in sales outlets and the commercial trade throughout the world, outside their original country of manufacture. There is a regular international movement and sale of medicines and raw ingredients that are not legal and do not have CITES permits.

FAKES AND FORENSICS

The trade in traditional Asian medicines includes large volumes of raw ingredients, particularly plant materials such as roots and bark. Identification of the huge variety of materials is very difficult, particularly when one sliced root looks, to the untrained eye, identical to any other. Some priority raw ingredients are fairly easy to learn to identify by eye at least as a preliminary measure, such as rhinoceros horn, tiger bone, musk deer pod, bear gallbladder, Saiga antelope horn and marine turtle shell. But generally, enforcement officials should refer to experts or make preliminary identification of raw ingredients based on information available that provides ingredient names, such as on labels, invoices or packing boxes. The identification of raw ingredients is made more problematic with the increasing trend towards production and trade in counterfeit versions of particular products. Some products are very high value due to their scarcity and there are significant volumes of fakes generated and traded, particularly in Asia. For evidential purposes, for seizure or prosecution, it is sometimes necessary to be absolutely certain about the species identity of a product or a raw material (depending upon national legislation). The only way to be certain is to obtain an expert witness statement from a forensic scientist who has examined or tested the product or part and has drawn conclusions about the true species identity. This part of the guide will briefly explore these issues and offer some guidance on identifying raw ingredients and fakes, and using forensic expertise.

Raw ingredients - where to start

Most raw ingredients will be labelled in bags, boxes or jars if in shipments, warehouses or in storerooms of pharmacies and retail outlets. The first step to identifying an ingredient is to compare the Roman, pinyin and/or Chinese characters to the name list in this guide. It is a matter of comparison and familiarisation with the characters and pinyin. If raw ingredients are not labelled and not obviously of interest (such as an animal horn or bones), it is best to refer to an expert or accept that identification is probably not possible.

If enforcers do wish to learn some basic identification skills for raw materials, it can sometimes be useful to learn to identify the most common ingredients in trade that are not controlled species but are typically found in most shipments or on sale in pharmacies etc. This allows the vast majority of materials by volume to be dismissed quickly, while more time can be spent focusing on the materials that are uncertain. There are many reference books that describe and illustrate these common ingredients, which are the staples of traditional Asian medicine prescriptions. Any enforcer who frequently deals with large shipments of such medicines would be advised to take this approach and obtain suitable reference books. A bibliography is provided at the end of this guide.

This guide includes pictures of the typical raw forms in which the main controlled species ingredients are commonly traded. These can be found in the section on identification of raw ingredients.

Animals

Animal parts are generally easier to identify than plants but only if they have not been processed. For example, many ingredients such as rhinoceros horn and elephant ivory are obvious if whole but if they are processed into shavings or powder then it is impossible to identify them by eye. For most processed material forensic analysis is probably the only option if the items are not labelled. The types of animal parts to look out for are bones, horns, tusks, gallbladders, shells and fur-covered glands (see section on fakes below). Identification beyond this level can only really be undertaken by an expert in animal identification.

Plants

Plant parts are probably the most difficult to identify as they consist of pieces of dried roots, barks, leaves, berries etc. at varying stages of processing, and can look fairly similar to one another. It is not worthwhile for enforcers to learn to identify such raw materials unless they are going to deal with such shipments or domestic trade on a regular basis. It is best to use experts when packaging for raw materials is not labeled. Agarwood is one high-value commodity that is more obviously identifiable, as it is usually traded as blocks of wood with fairly distinctive characteristics, but sometimes as wood chips. It may be worthwhile being familiar with the appearance of this species (see section on fakes below).

Fakes - raw ingredients commonly counterfeited

Those parts and derivatives that are of the highest value due to scarcity of supply and/or high demand are subject to counterfeiting. Because the ingredients are not commonly in trade, it is easier for counterfeiters to convince buyers that they are the genuine articles, as they are not often seen. In fact, the fake ingredients are much more common, so much so that they may even be recognized as being genuine by those less experienced in traditional Asian medicine. The examples below are the main parts and derivatives that tend to be counterfeited, including a short summary of the differences between the genuine and the fake.

Tiger

Bone - any genuine bone of a tiger can be used in traditional Asian medicine but fake bones tend only to represent the bones from limbs, as these are more valuable as they are deemed more potent. Whole bone joints can be fashioned from a variety of species such as cow, or bones from other species such as other big cats and bears are claimed to be tiger. The humerus bone of big cats (front limbs, upper bone) has a distinctive 'hole' at one end which in traditional Asian medicine is called the 'phoenix eye'. This is used to distinguish it as being genuine in trade. Fake paws and lower limbs produced from cow limbs are commonly seen in trade in Asia, which include claws and fake fur with tiger stripes painted onto them. Several tests on broken pieces or powdered tiger bone in trade have shown only a small percentage to be genuine. More commonly, the bones are from domestic animals such as cows and pigs, although other species such as bear and monkey have been detected.

Penis - the penis of a tiger is very rarely seen in trade but a wide variety of fakes are often

found, fashioned from a range of materials such as cow penis, or deer tendon. The fakes tend to be large and cleverly crafted with barbs cut into the tip to look like a cat penis. The most obvious difference between the fake and genuine items is size, with fakes being up to 50 cm long but the genuine item is usually around 5 cm.

Modified cattle penis © US Fish and Wildlife Service, National Fish and Wildlife Forensic Laboratory

Rhinoceros

Horn - fake whole rhinoceros horns are crafted from buffalo horn, wood and even resin. Buffalo horn tends to be smoother and slightly shiny with a less fibrous appearance on the surface and the base does not have the same porous, sponge-like appearance as in rhinoceros horn. For enforcement purposes, it is simply necessary for enforcers to be aware of the general appearance of the types of real rhinoceros horns that exist (smaller rounded Asian horn, larger longer and pointed African horns) to enable initial recognition. They also need to realize that any horns they come across may be counterfeit and that expert identification is usually needed. Rhinoceros horn can also be traded as shavings, pieces or powder and these are fairly easy to fake by using other materials. Sometimes shavings from the horns of other species may be used such as buffalo or Saiga antelope.

Bear

Gallbladders - the gallbladders from pigs are frequently traded as bear gallbladder, and it is estimated that at least half of all gallbladders traded are fakes. Gallbladders can be traded fresh, frozen or dried but the dried form is more usual. Preserved bear gallbladders can vary widely in colour (usually brown to black), and genuine gallbladders are sometimes the same colour as pig gallbladders.

Musk deer

Musk pods and grains - the genuine pod of a musk deer is walnut-sized and covered in fur and when dried it contains red-brown to black granules and powder of musk. The pods and their contents can be counterfeited by making pods from any fur and adding substances to resemble the grains. The fake pods are often distinguishable because they are too large, up to the size of a tennis ball. Genuine musk pods are also known to be often filled with fake grains. Pods are normally dried but can be traded frozen.

Agarwood

The wood is counterfeited by substituting other types of wood from different species; sometimes it is stained to the appropriate rich brown colour and soaked in chemical perfumes to resemble the scent of Agarwood. The wood can be in the form of powder, chips, hand-sized pieces or short pieces of timber. If the wood is very light brown or almost black it is more likely to be fake and also if it has a strong chemical perfume smell, rather than a more subtle natural scent.

Fake agarwood © Stephanie Pendry / TRAFFIC

Forensics - expert identification of raw ingredients and manufactured products

Once an enforcer has flagged that there may be items within a shipment or at a pharmacy etc. that could potentially include controlled species, they will need to refer to experts for positive identification. The main types of centres of expertise are listed below:

Wildlife forensic laboratories	Government laboratories
Commercial forensic laboratories	Universities
Natural history museums	Zoos
Botanic gardens	Veterinarians
Conservation organisations	Recognised experts and academics

If the items are whole parts then it is relatively simple for an expert to identify the specimen: usually a natural history museum, botanic garden or university would be most appropriate. Identification may involve simple morphological studies or microscopic examination. Once a specimen has been processed to any degree, identification becomes more difficult. If ingredients have been highly processed and mixed with other ingredients, only sophisticated forensic techniques can hope to provide a definitive answer that will be acceptable in court. Typically, the contents of manufactured traditional medicines are very difficult to determine because of the methods of manufacture and the large range of ingredients that may be mixed together. Often DNA identification techniques are the only solution but even these methods are not always conclusive. Other forensic techniques are also available for determining whether particular species are contained within medicines, such as thin layer chromatography. Under CITES it is not necessary to prove whether the species is actually contained within a processed medicine, if the ingredients of the medicine claim to contain it. However, in some countries domestic laws may require that it is proven to genuinely contain the species claimed, if a successful conviction is to be achieved. More significant penalties for offences are also more likely to be applied if it can be proven that endangered species are being traded.

There are a number of tests that can be applied. Thin layer chromatography has proved successful in identifying bear gallbladder, bile, musk, cobra bile and agarwood. The costs, reliability and speed of testing vary greatly between different tests, laboratories and countries. Often this is dependent on the nature of the sample. Some techniques are commonly available in most laboratories, yet some are only possible in the few that have perfected the test. A hydroxyl appetite test can be used to determine the presence of bone, which has been used to indicate the presence of tiger or leopard bone but this is not conclusive.

Identification based on name systems: common, scientific, Chinese characters, Pinyin and Roman

The two pages that follow lists the most common words used to describe animal and plant parts in English, followed by the Chinese character, Pinyin and Roman. Pinyin is the phonetic sound of the Chinese words, and Roman is the pharmaceutical name given to the ingredients. Both Pinyin and Roman are often used on medicinal packaging as well as Chinese characters. Following these pages, the next 3 pages list the most commonly found species and the forms in which they appear in medicinal products, and gives the common name, scientific name, Chinese characters, Pinyin and Roman equivalents and species CITES Appendix and EU Annex listing. 	NAMES	FORMS / PHYSICAL CHARACTERISTICS	GEOGRAPHIC DISTRIBUTION	CITES APPENDIX / EU ANNEX
A B	Common: gastrodia, gastrodia rhizome, gastrodia tuber Scientific: <i>Gastrodia elata</i> Pharmaceutical: gastrodiae rhizoma, rhizoma gastrodiae elatae	Root stock oval to oblong, somewhat flattened, often curved, 3-15 cm long, 1.5-6 cm wide and 0.5-2cm thick, hard, horny and not easily broken. Exterior yellowish white to grey-brown, strongly longitudinally wrinkled due to shrinkage. Cut drug is extremely fine, light, almost semi translucent, only 1-3mm thick slices of rootstocks. Pale to light brown on which vascular bundles appear as speckles or short streaks. Weak odour.	From Himalayas through China to Japan and Korea and northwards to Russian far east.	Appendix II / Annex B All species of <i>Gastrodia</i> are II/ B Includes subfamilies Apostasioideae and Cyripedioideae. Designates all parts and derivatives, except: a) seeds and pollen (including pollinia); b) seedling or tissue cultures obtained in vitro, in solid or liquid media transported in sterile containers; c) cut flowers of artificially propagated plants; and d) fruits and parts and derivatives thereof of artificially propagated plants of the genus <i>Vanilla</i> .
C D	Common: agarwood, aloe wood, eagle wood, gaharu wood, paradise wood Scientific: <i>Aquilaria malaccensis</i> Pharmaceutical: aquilariae lignum, lignum agallochi, lignum aloes, lignum aspalathi, agar, aggar, uggor	Wood pieces irregularly shaped, prone to splitting, with uneven surface, knife marks and sometimes signs of rotting. Fractures or cut surface strongly fibrous. Colour varies from yellow-brown to brown to dark depending on resin level. Darker lines and spots on section surfaces mark the resinous areas filled with amber coloured to black shining resin. Resin ignites easily and exudes oil when burning. Wood pieces rich in resin (ie no light wood parts lacking resin) are dark, almost black, hard, heavy and sink in water. Odour weak at room temperature, strongly aromatic when burning.	Bangladesh, Bhutan, Cambodia, India, Indonesia, Lao PDR, Malaysia, Myanmar, Philippines, Singapore, Thailand.	Appendix II / Annex B Designates all parts and derivatives except: a) seeds, spores and pollen (including pollinia); b) seedling or tissue cultures obtained in vitro, in solid or liquid media transported in sterile containers; and c) cut flowers of artificially propagated plants [added 18 September 1997]
E F	Common: Indian gentian, picrorhiza rhizome Scientific: <i>Picrorhiza kurroa</i> Pharmaceutical: picrorhizae rhizoma, picrorhiza	Rootstock cut or broken into pieces, mainly without rootlets, fragments cylindrical, light weighted, straight or slightly bent, mainly unbranched, 2-8cm long and 4-10 mm thick, light grey to dark grey brown, longitudinally wrinkled, irregularly thick, highly inflammable. Surface with scars of numerous scaly leaves and roots. Odour pleasant, slightly aromatic.	Western Himalayas, altitudes of 2500-4000 m, from Afghanistan to the southernmost part of China.	Appendix II / Annex B Designates whole and sliced roots and parts of roots, excluding manufactured parts or derivatives such as powders, pills, extracts, tonics, teas and confectionery

	NAMES	FORMS / PHYSICAL CHARACTERISTICS	GEOGRAPHIC DISTRIBUTION	CITES APPENDIX / EU ANNEX
A B	<p>Common: Common bletilla, bletilla tuber, bletilla rhizome</p> <p>Scientific: <i>Bletilla striata</i></p> <p>Pharmaceutical: bletillae rhizoma, tubera bletillae, bletillae tuba, rhizoma bletillae</p>	<p>Tuber irregularly shaped, often with 2-3 claw-shaped branches, hardy, horny, does not break easily, 1.5-5 cm long and 0.5-1.5 cm thick, top presents a prominent shoot scar. Surface with several concentric lines, mainly grey-white, yellowish white to pale brown, with small brown dotted root scars, sometimes with remainings of roots. Cut drug is thin, up to 5mm thick, irregularly shaped, often semi translucent slices of root tuber, cut surface white or pale yellow, with visible vascular bundles, seen as longitudinal stripes or white dots depending on the cut. Faint odour.</p>	<p>China (from east Tibet and Gansu in the east and Yunnan and Jiangzi in the south) through the Republic of Korea to south of Japan.</p>	<p>Appendix II / Annex B</p> <p>All species of Bletilla are II / B</p>
C D	<p>Common: Dog fern, golden moss, Scythian lamb, chain fern rhizome, cibot rhizome</p> <p>Scientific: <i>Cibotium barometz</i></p> <p>Pharmaceutical: cibotii rhizoma, cibotii barometz rhizoma</p>	<p>Pieces irregular 10-30 cm long and 2-10 cm in diameter, hard, solid, not easy to break, surface dark brown with thick dense golden yellow velvety hairs. Cut drug 1.5-20mm thick, irregularly shaped and sized, external surface often with remains of the velvety hair covering. Pieces brittle, easy to break, fracture powdery. Cut surface light brown to black brown, flat, smooth. Scentless.</p>	<p>From North India through south China to Japan and to the south east through Vietnam and Thailand to Papua New Guinea.</p>	<p>Appendix II / Annex B</p>
E F	<p>Common: dendrobium</p> <p>Scientific: <i>Dendrobium</i> spp.</p> <p>Pharmaceutical: dendrobium caulis, dendrobii herba</p>	<p>Stem pieces, if not cut, 15-120 cm long, often bent, with several stems branching from one rootstock, root attachments visible. Stems mainly cut into 4-10 cm long pieces, straight or slightly curved, supple, without leaves, easy to break and then a loose fibrous interior is revealed. Surface golden yellow - green, to dark yellow, shining, longitudinally grooved. Cut stems are ribbed and therefore star shaped in outline. Odourless to weak.</p>	<p>From India and Sri Lanka eastwards to Japan and in south east Asia through Malaysia, Indonesia, Papua New Guinea to Australia and through the Pacific islands to New Zealand.</p>	<p>Appendix II / Annex B</p> <p><i>D. cruentum</i> is on Appendix I / Annex A, all other species are II / B</p>

	NAMES	FORMS / PHYSICAL CHARACTERISTICS	GEOGRAPHIC DISTRIBUTION	CITES APPENDIX / EU ANNEX
A B	Common: Himalayan spikenard, Indian nard, Indian valerian, jatamansi root, musk root Scientific: <i>Nardostachys grandiflora</i> Pharmaceutical: nardostachys jatamansi rhizoma, radix nardostachys, spica nardi, nardus indica	Rootstocks oblong, straight or slightly bent, 1-15cm long, as thick as a finger, covered with a dense layer of fine, dark grey to grey-brown fibres. Rootstock at tip sometimes with leaf remains, inside reddish brown, rootstocks mainly whole. Odour aromatic.	Himalayas, in the west from Uttar Pradesh in north west India eastwards through Nepal, Bhutan to the northeast of Myanmar and to China in the provinces Yunnan, Sichuan and Kansu as well as northwards into Tibet.	Appendix II / Annex B Includes parts and derivatives except: a) Designates whole and sliced roots and parts of roots, excluding manufactured parts or derivatives such as powders, pills, extracts, tonics, teas and confectionery
C D	Common: Chinese / Korean / Asian ginseng Scientific: <i>Panax ginseng</i> Pharmaceutical: ginseng radix	Asian ginseng: show many more lateral roots. Russian wild roots are recognisable since main and lateral roots are wrapped with a thin string.	Asian ginseng: Northeast China, DPR Korea, south-east of Russian Far East	Appendix II / Annex B Asian ginseng: Population of the Russian Federation; parts and derivatives to be covered; whole and sliced roots and parts of roots, excluding manufactured parts or derivatives such as powders, pills, extracts, tonics, teas and confectionery
E F	Common: American ginseng, Canadian ginseng, dwarf groundnut, five fingers, manroot, red berry, five-leaved panax root, Scientific: <i>Panax quinquefolius</i> Pharmaceutical: panacis quinquefolii radix, aralia quinquefolia	American ginseng: Roots cylindrical or spindle shaped 5-20 cm long, 0.5-3 cm thick at the top, tapering towards the bottom and often bent, from mid section sometimes repeatedly divided into root branches, very hard, brittle and not easily broken. Root scars and stem scars present. External surface wrinkled. Weakly aromatic.	American ginseng: east of North America, in Canada from south Quebec and Ontario to Manitoba, in the USA in the south to Georgia and Alabama and eastwards to Minnesota, Iowa, Missouri, Oklahoma and Louisiana.	Appendix II / Annex B American ginseng: designates whole and sliced roots and parts of roots, excluding manufactured parts or derivatives such as powders, pills, extracts, tonics, teas and confectionery

	NAMES	FORMS / PHYSICAL CHARACTERISTICS	GEOGRAPHIC DISTRIBUTION	CITES APPENDIX / EU ANNEX
A B	Common: snakewood, serpentwood, serpentine root, rauwolfia root, serpentine wood, snake root, devil pepper Scientific: <i>Rauwolfia serpentina</i> Pharmaceutical: rauwolfiae radix, lignum serpentinum, radix mustelae, rauwolfia serpentina	Roots cylindrical, somewhat tortuous or bent, rarely branched, 4-10 cm long, 5-15 mm diameter. Small lateral rootlets lacking, external surface grey to yellowish brown, dully, weakly longitudinally wrinkled, rough, with few small circular root scars in 4 rows. Older roots yellowish white when abraded. Roots highly inflammable, fractures short and irregular. Fresh transverse section whitish to bright yellow turning grey brown with dense fine pored rootwood. Roots rich in starch, provable by colour reaction with alcoholic or aqueous iodine-potassium iodide solution. Odourless.	From Pakistan through the Himalayas to southeast China, in India from Himalayas disjunct to Sri Lanka and the Andaman Islands, as well as in southeast Asia to Sumatra, Borneo and Java.	Appendix II / Annex B Designates all parts and derivatives except: a) seeds and pollen; b) seedling or tissue cultures obtained <i>in vitro</i> , in solid or liquid media transported in sterile containers; and c) cut flowers of artificially propagated plants [added 18 September 1997] and d) chemical derivatives and finished pharmaceutical products
C D	Common: saussurea root, aucklandia, costus Scientific: <i>Saussurea costus</i> Pharmaceutical: saussureae radix, radix costus, aucklandiae radix, radix aucklandiae lappae	Root pieces irregularly shaped, mainly 5-10 cm long and 0.5-6 cm thick, strong, hard and firm, thick pieces hardly breakable, external surface grey to dark brown, dull. Thinner roots also longitudinally grooved, lateral roots mainly lacking. Pieces often split longitudinally revealing whitish yellow to dark brown root wood. Roots sliced transversely or longitudinally. In transverse section root clearly divided into 3 parts, root bark very thin, layer below bark is light brown delimited by a dark circular marking, inner part light brown, yellowish to white, radially striped. Odour very characteristic, strong, unpleasant.	Himalayas, from Pakistan through Kashmir to Garhwal in north India	Appendix I / Annex A All parts and derivatives are controlled. Under the current CITES provision, cultivated saussurea root imported or exported with a CITES permit can be traded as if an Appendix II species.
E F	Common: Himalayan yew Scientific: <i>Taxus wallichiana</i> Pharmaceutical: taxi folium, folia taxi	Bark reddish brown, thin, scaly, twigs irregularly alternate, leaves spirally arranged (needles) flattened, leathery, 20-40 mm long and 2-3 mm wide, gradually tapering. Upper surface domed, dark greenish, shiny, with distinct midrib, lower surface mainly paler. Buds at the ends of twigs and in the axis of the needles 3-4 mm long. Bud scales ovoid to rounded, strongly appressed. CAUTION: this drug is toxic.	From Afghanistan and Pakistan through the Himalayas to southwest Tibet and in southeast Asia to Indonesia and the Philippines.	Appendix II / Annex B Design all parts and derivatives, except: a) seeds and pollen; b) seedling or tissue cultures obtained <i>in vitro</i> , in solid or liquid media, transported in sterile containers; c) cut flowers of artificially propagated plants; and d) chemical derivatives and finished pharmaceutical products.

IDENTIFICATION OF PATENT MEDICINES: PACKAGING AND DESCRIPTION

The medicines detailed here have been divided into sections by product type, as described in the section 'How to use this guide'. Each image corresponds to descriptive text referred to in the associated table on the opposite page referenced by a letter. The information contained in each column is described below. Note that the spelling of the product name and manufacturer are as printed on the packaging, including what appear to be spelling errors.

Column title	Information
Product Name	The traditional or manufacturer's name for the medicine as indicated on the packaging
Manufacturer	The name of the manufacturing company and the country of manufacture
Ingredients	The target species products that are listed in the ingredients or depicted on the packaging. Where an ingredient is listed within brackets e.g. (tiger) this indicates that the species product is not listed in the ingredients but appears elsewhere on the packaging, either as text or an image
Notes	Other significant information relating to that medicine, including its unique reference number if present, and its similarity to another product

ANNEX

HOW THE TRADE OPERATES

The trade in traditional Asian medicines operates in many ways no differently from any other type of trade that is on the whole a legal business but with some illegal elements. As with most types of trade, there are source countries, consumer countries and transit countries involved, and any country could be one, or a combination, of these. The trade in traditional Asian medicines is a complex system of interactions, organisation, traditional beliefs and modern influences. However, the trade falls into three main categories for the purposes of explaining the key mechanisms within the trade: international trade, domestic trade and distribution. As with any overview, the information provided here is a generalisation, which emphasises how the international trade has operated over the boom period of the 1990s.

Legislation: The international level

The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)
CITES entered into force in 1975. It is an international treaty that provides controls on international trade in wildlife that is threatened with extinction or may become so due to international trade. Control is achieved by requiring permits and certificates before allowing international trade to proceed, with the level of control depending on how endangered the species is by trade. The most endangered species are listed in Appendix I, and international commercial trade in these is generally prohibited. In the exceptional circumstances when trade is allowed, CITES import and export permits or re-export permits are both required. Species listed in Appendix II are not necessarily endangered, and commercial trade is allowed but requires CITES permits from the exporting country only (unless stricter national measures are imposed, as in the EU for example). Appendix III includes species specifically protected by one or more of the countries in which the species is found. The species cannot be exported from these countries without an export permit. Certificates of origin are required to export these species from other countries. CITES applies to all specimens of species of plants and animals listed in its appendices, whether whole (alive or dead), or parts and products such as skins, carvings and medicines. CITES is a complex treaty, and has a large number of resolutions relating to its interpretation, definition and application. By October 2004 there were 166 countries that were parties to CITES.

The European Union wildlife trade regulations

All Member States of the EU implement CITES through the following EU regulations, which include all the provisions of CITES as well as some additional, stricter, measures.

Council Regulation (EC) no 338/97 of 9 December 1996 on the protection of species of wild fauna and flora by regulating trade therein, as amended

Commission Regulation (EC) No 939/97 of 26 May 1997 laying down detailed rules concerning the implementation of *Council Regulation (EC) No 338/97* on the protection of species of wild fauna and flora by regulating trade therein, as amended

Species covered by the EU Regulation are listed in four Annexes, with the most endangered listed in Annex A (broadly equivalent to CITES Appendix I). Species threatened by commercial trade are listed in Annex B (broadly equivalent to CITES Appendix II). Wildlife products

labelled as containing species listed on the Annexes are treated as if they actually contain them, without the need for proof. Requirements for international trade in species listed in these Annexes are:

Import permits for Annex A and Annex B specimens required at first point of introduction into the EU;

Import notifications for Annex C and Annex D specimens required at first point of introduction into the EU;

Export or re-export permits required for Annex A, B and C specimens for export outside the EU; and

Commercial trade within the EU in Annex A specimens generally prohibited, but with some exceptions.

International trade

The international trade generally originates from source countries in East and Southeast Asia, to countries either within or outside these regions. The flow of manufactured products and raw materials is mainly from China. The trade from China is destined for other countries in East and Southeast Asia and countries where there are large ethnic Asian communities. The products manufactured in Southeast Asia tend to be exported to other countries in that region, with some trade to markets in other countries where there are large ethnic Asian communities. There is some re-export of products and materials, often after repackaging for the particular market they are aimed at. This happens quite extensively in Europe, for example.

Transport methods

The type of transport method depends upon the volume, product type and legality of the goods. There are four main transport methods:

1. Via container shipments

This trade is high-volume, consisting mainly of manufactured products and is mostly legal. The large volume of mainly legal manufactured products lends itself to be transported in this way unless the products are perishable. The containers usually carry large boxes of packaged, manufactured products and/or raw materials such as roots, berries, herbs, bark, powders etc. Sometimes large plastic bags inside the boxes will contain unlabelled pills that will later be packaged for sale. Very often the raw ingredients will be bagged with the Chinese characters written on the outside to identify the contents and shipped inside containers. These shipments are often described on the manifest as 'tea' or 'herbs'. Sometimes prohibited items are loaded in the middle of a container to reduce the likelihood of detection, or in mis-labelled boxes e.g. 'acupuncture needles'. More recently TCM shipments have been mixed in furniture shipments which are then declared only as furniture to evade controls. TCMs have also been hidden in boxes marked as dried herbs. Another method is to send TCMs without any packaging through one port, and send the outer packaging showing the controlled ingredients via another port.

2. As air freight

This method of transportation is usually reserved for low-volume products and raw materials, sometimes illegal. Because of its high cost, this method of transport is usually for small-sized, high-value goods. Any shipper attempting to smuggle illegal goods by this means of transport usually relies on misdescription of the contents to avoid detection. Medium-sized freight parcels may also be transported in this way.

3. Via personal transport with air/sea passengers

This is mainly for very low volumes, usually of raw materials but also of products, and also of the highest value goods, which are more likely to be illegal. Passengers will often carry supplies for themselves and their families. These may be raw ingredients such as ginseng roots, or a few boxes of tiger bone plasters. However, some pharmacists will transport the more expensive and sometimes illegal products themselves, to supply their business needs. Expatriates will often combine a trip home to Asia, with a chance to stock up their business. The goods are rarely declared but often there is no great attempt at concealment, and they are usually contained in a suitcase or hand carried parcel. Sometimes concealment of illicit goods such as rhinoceros horn does occur, by disguising the goods inside another container, secreted within luggage. The majority of high-value illicit items are moved internationally in this manner.

4. Via mail/courier service

As with personal baggage, this method is mainly for high-value, low-volume products and raw materials, which are sometimes illegal. There is a regular and legitimate international movement of the higher value goods from source countries to consumer countries (usually to pharmacies or wholesalers). Sometimes the illegal trader will send these items via the mail or a courier service to reduce chances of detection and as a cheaper option than as personal baggage. Using this method also reduces the chance of being detected in person, as it is always possible to deny involvement or knowledge of any parcel received or sent. Traders realise that monitoring the volume of mail that moves around the world is an enormous challenge for the authorities. This *modus operandi* is increasingly being used as a way to smuggle illicit goods.

International business links

Many traditional pharmacies/doctors/clinics/wholesalers etc. in consumer countries will have strong links with manufacturers or suppliers in source countries. Sometimes a trader in a consumer country may be a subsidiary company of the parent organisation in the source country. The supply and method of transport is arranged between them through normal business practices. Arrangement for smuggling of illicit goods is usually conducted by telephone or personal letter, although email is becoming the norm. The goods may be marked only with company catalogue or product numbers, making identification much harder without access to the relevant catalogue.

Trade routes

Raw ingredients move from the source country to the country of manufacture, a percentage of the medicines manufactured will be for the domestic market, and the remainder for export to consumer countries. For example, rhinoceros horn from Africa may be smuggled by air to East Asia in a suitcase for processing and domestic use, but it may be used to manufacture patent medicines, a proportion of which may be sent via express mail courier to Australia for distribution and sale (in traditional pharmacies). Raw ingredients may be exported direct to consumer countries where they will be used in prescriptions made up by pharmacists. For example, tiger bone may be smuggled from India by land across several borders into East Asia where it is likely to be consumed domestically, but it may be processed and illegally exported to the UK for prescription by traditional Asian medicine doctors. In countries outside Asia with large ethnic Asian communities, raw ingredients may also be used from domestic sources to meet the demand for traditional medicines. For example, bear gall bladders from native species in Canada are traded for use in traditional medicine prescriptions amongst traditional Asian medicine users in Canada. The flow of raw ingredients can come from anywhere with populations of species that are in demand in traditional medicines, and via any route or by any method. This greatly increases problems of detection for enforcement agencies around the world.

Transit

The movement of shipments through transit countries generally follows traditional routes. However, interception of some shipments on an unusual routing has resulted in seizures of illicit goods. The key transit countries can yield seizures, where those countries have the necessary legislation and enforcement powers to inspect transit shipments. The significance of transit points is important, particularly where the country of destination has weak controls on imports. Some countries that feel it is their responsibility to deal with transit shipments can detect routes and illegal trade that would not otherwise be discovered, as the source and consumer countries may not have the resources to put as much effort into controlling such trade.

Domestic trade outside East Asia

The domestic trade in consumer countries tends to focus around the concentrations of ethnic Asian populations. That is not to say that the end-consumer or practitioners are solely of Asian origins. There is a rapidly expanding interest in these traditional medicine practices by consumers and doctors of the indigenous populations of the consumer countries. For example, in the UK alone there are over 300 registered traditional Chinese medicine practitioners who are not of Asian descent and up to 50% of patients receiving treatment from traditional medicine practitioners are not of Asian origins.

The vast majority of domestic trade in traditional medicines is legal. It is often found that within any type of trading business there will however be a number of products that are illegal, be they manufactured medicines or, less frequently, raw ingredients. It is difficult to ascertain whether a business premises is trading in restricted products illegally.

Illegal products are usually mixed with many legal products or they may not be on display and only provided unless they are specifically requested. It is also increasingly common for product packaging to be altered (either at point of manufacture, repackaging or by hand by the trader) to remove any mention of containing restricted species. Products previously identified as being illegal may no longer be so with the latest version of the packaging. The question still remains as to whether the ingredients themselves have also changed or only the packaging. This can only be answered with forensic testing or examination of manufacturing processes, both of which are often difficult and costly processes.

There are a number of different sectors involved in the TAM trade:

•Wholesale company

Specialises in imports of traditional medicines (products and raw materials) and distributes to retail outlets and clinics

•Clinic

A traditional Asian medicine clinic which may incorporate several doctors and sometimes have its own pharmacy

•Doctor/practitioner

May have their own business to review patients and make a diagnosis, either selling medicines directly to patients or recommending a local pharmacy to dispatch the prescription provided

•Pharmacy

Sells packaged products and raw ingredients, will make up a prescription for the patient supplied by a traditional doctor, using raw materials

•Supermarket

A retail outlet which does not specialise in traditional medicines but may offer a limited range of medicinal goods, mainly packaged products but also some raw materials such as roots and herbs or American ginseng

•Asian goods retail outlet

A retail premises that specialises in goods from Asia, such as arts and crafts, may also offer a limited range of manufactured products

•End-consumer

The patient who consumes the traditional medicine.

Distribution and trade dynamics

Within East Asia some of the trade will be domestic without relying upon imports, using domestically produced raw materials and packaged products. For countries outside East Asia the trade will predominantly rely upon imports from East Asia and Southeast Asia. Outside Asia some domestically produced ingredients may, however, be used where appropriate, for example, pig gall bladders are often traded domestically as fake bear gall bladders. In Canada, local black bear galls are used in traditional medicine, sometimes legally when they have been shot under licence.

For large commercial import shipments (usually arriving at sea ports) the goods will be delivered, to either a wholesaler in traditional medicines or to a pharmacy or clinic that is restocking its supply or setting up for the first time. These goods will then be either resold to other traders or to the end-consumer. The wholesaler operates by means of advertising and circulating price lists amongst Asian communities. Some wholesale companies will provide a postal service, sometimes even to the level of making up prescriptions and posting them to the end-consumer. Clinics and pharmacies will often purchase their raw materials and products from a wholesale company if they are not large enough to import themselves. Smaller pharmacies outside the main centres may even purchase materials from other larger pharmacies in the main centres. Supermarkets will tend to import goods directly or purchase from a wholesale company. The medicinal goods they trade in are only a small element of their entire stock, which is mainly Asian foodstuffs.

The trade in the majority of the traditional medicines is legal in terms of international wildlife trade regulations though may be illegal under national medicine, and / or veterinary health regulations. However, a small degree of the trade that takes place will be in restricted ingredients such as rhinoceros horn and tiger bone. This trade operates behind the scenes and is usually only carried out between close trading partners or trusted customers. Since the ban in China in 1993, on possession and trade in tiger and rhinoceros parts, and enforcement actions in many countries, the trade no longer operates openly in these commodities. With packaged products, fewer medicines now claim to contain such restricted ingredients and whilst the basic packaging may look the same, the ingredients lists have changed. There are however, a number of counterfeit medicines that are copies of well-known brands, which still use the original ingredients list for the product.

HM Customs and Excise
Law Enforcement

HM Customs and Excise are responsible for enforcing CITES and European Union wildlife regulations at import and export. Customs has a dedicated team of officers based at Heathrow airport who specialise in wildlife law enforcement and intelligence gathering. This team is supported by a network of officers based in the Customs regions around the United Kingdom.

HM Customs and Excise CITES Team, Custom House, Nettleton Road, Heathrow Airport, Middlesex, TW6 2LA. www.hmce.gov.uk

TRAFFIC.

TRAFFIC, the wildlife trade monitoring network, works to ensure that trade in wild plants and animals is not a threat to the conservation of nature. It has offices covering most parts of the world and works in close co-operation with the Secretariat of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES).

TRAFFIC International, 219a Huntingdon Road, Cambridge, CB3 0DL, UK. www.traffic.org

WWF's mission is to stop the degradation of the planet's natural environment and to build a future in which humans live in harmony with nature, by conserving the world's biological diversity, ensuring that the use of renewable resource is sustainable and promoting the reduction of pollution and wasteful consumption.

WWF-UK, Panda House, Weyside Park, Godalming, Surrey, GU7 1XR, UK. www.wwf-uk.org

The CITES Secretariat helps the Parties to implement CITES by providing interpretation of the provisions of the Convention, and advice on its practical implementation. The Secretariat also conducts a number of projects to help to improve the implementation, such as giving training seminars and developing training materials, as well as examining the status of species in trade, and ensuring that their exploitation remains within sustainable limits.

CITES Secretariat, 15 Chemin des Anémones, CH-1219 Châtelaine, Geneva, Switzerland. www.cites.org

The Partnership for Action against Wildlife Crime (PAW) is a multi-agency body comprising representatives of the organisations involved in wildlife law enforcement in the UK. It provides opportunities for both statutory and non-Government organisations to work together to combat wildlife crime. Its main objective is to promote the enforcement of wildlife conservation legislation, through supporting the networks of Police and Customs officers. Department for Environment, Food and Rural Affairs is the Secretariat for PAW.

Department for Environment, Food and Rural Affairs, Temple Quay House, 2 The Square, Bristol, BS1 6EB, UK. www.defra.gov.uk/paw

Taiwan's Council of Agriculture is the principal agency responsible for wildlife conservation at the executive level. The Council of Agriculture oversees implementation of Taiwan's Wildlife Conservation Law (WCL) which covers a range of conservation issues affecting wild fauna, including domestic and international trade in protected species.

Council of Agriculture, 37 Nanhai Road, Taipei, Taiwan 100-14. eng.coa.gov.tw
